
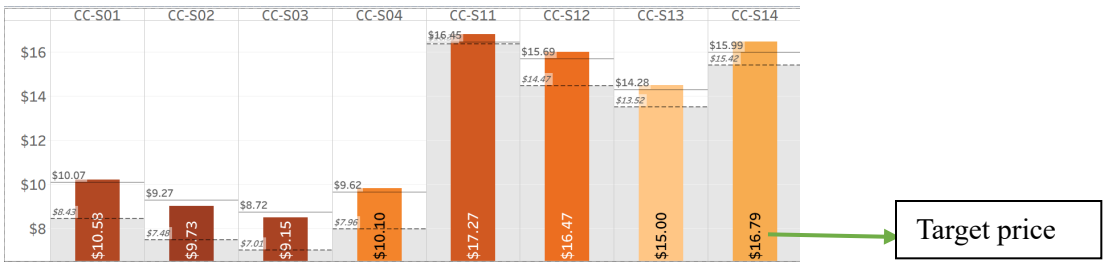
Price:

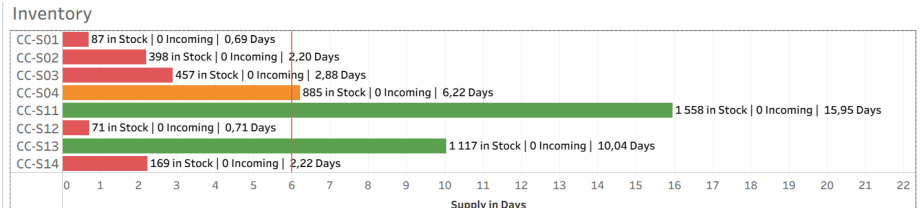


The bar length represents the price set in the SAP simulation. The dash line represents the production cost, while the solid line represents the market price. The price written in each bar is the price to reach our target, so the price that is 5% higher than the market price.

Each bar corresponds to one product: the higher the bar, the higher the price and vice versa.

- The colours:
  - The darker the colour, the more profit we've made.
- The labels
  - The Y-axis represents the price sold of the product (black arrow)
  - The X-axis represents the product (blue arrow)

Inventory:



- The bar length represents total supply in days, meaning it visualizes exactly how long your current stock will last based on your average daily sales velocity.

- The colours:

- Red (critical): supply < 6 days, meaning you are in the danger zone, you must order immediately or the stock will run out.
- Orange (warning): 6 days < supply < 8 days, meaning you need to order soon, probably within 1-2 days.
- Green (ok): supply > 8 days, meaning you are safe and have plenty of stock.

- The labels:

- The X-axis is supplied in days; it measures the number of days your stock will last. The scale runs from 0 to 16+ days.
- The Y-axis is a product list; it shows the products you have in the organization.

Order Size:

Ordering

	MRP	Order QTY
CC-S..	1 907	1 820
CC-S..	2 734	2 336
CC-S..	2 396	1 939
CC-S..	2 152	1 267
CC-S..	1 476	0
CC-S..	1 506	1 435
CC-S..	1 682	565
CC-S..	1 148	979
Tot..	15 000	10 258

- MRP is material requirements planning; it measures the number of needed materials by forecast. It would be the number you enter into ME59N in the ERP Sim. The calculation formula is:

Amount to Order = Forecast – Amount Remaining in Inventory or Being Delivered

- Order QTY is order quantity, meaning the number of you need to purchase from your suppliers.

Marketing:

Marketing

	North	South	West
CC-S01	5	3	
CC-S02		5	5
CC-S03		2	3
CC-S04	3		
CC-S11			
CC-S12	2		2
CC-S13			
CC-S14			

The marketing table has two variables. The first one represents the different regions where it sets the activity of the market, and the second represents each product.

- The columns represent each region such as North, South and West.
- The rows represent each product (X)

The colours represent the products with the highest sales on the market. The darker the colour, the more units are sold; accordingly, these products receive a higher marketing budget.

The numbers in each box represent the marketing budget allocated to each product in each region.
